

Petition for Consideration: Protecting Academic Freedom

Frank Kaufmann

June 17, 2020

Nikolai Ivanovich Vavilov was a Soviet geneticist, botanist and agronomist, and collector of one of the world's largest seed banks, who was sentenced to death in July 1941 for defending scientific truths about genetics. While he escaped his death sentence, he lived the last twenty years of his life in a Soviet labour camp, disgraced and ostracised. His crime was to have criticised Lamarckian inheritance—the notion that changes to an organism in its lifetime can be passed on to offspring via genetics. Because Lamarckian inheritance emphasised the importance of the environment it was the favoured evolutionary theory among the socialists and communists of the time, and thanks to the advocacy of Trofim Lysenko, scientists who departed from this orthodoxy were shunned, persecuted, and in the case of Vavilov, sent to a gulag. When the siege of Leningrad occurred, Vavilov and a group of botanists who were holed up in a secret vault, famously chose to starve themselves before consuming their seeds, which they were preserving for the sake of humanity. While Vavilov died in obscurity, he is now recognised as one of the greatest Russian scientists of all time.

Thankfully in 2020, geneticists are not forced to conform to pseudoscientific orthodoxies, no communist dictatorship exists in the West, and nobody is at risk of being sent to a labour camp to spend decades of their life in obscurity. Lysenkoism does not prevail, and scientists accept the reality of Mendelian genetics, most of the time. Nevertheless, ideas of environmental determinism do remain surprisingly persistent. Pseudoscientific ideas that deny biological or evolutionary truths are discussed in Quillette on a weekly basis. If you are reading this now, you will be familiar with them. The most recent example we have highlighted was the "controversy" surrounding [JK Rowling for emphasising the reality of biological sex](#).

Today, another scientist is being persecuted for discussing scientific truths. His name is Stephen Hsu, and he does not work in Russia, or China, but in the United States of America, at Michigan State University. He is being targeted by a Twitter mob and group of post-graduate students for his research and writing, and is being misrepresented and slandered as a "racist" and "sexist" despite condemning racism and sexism repeatedly in his public blog posts and interviews.

You can read the case against Professor Hsu [here](#) (keep in mind that many of these allegations are misrepresentations and exaggerations of his work) and Stephen's reply to the charges [here](#). I have been informed that Professor Hsu's job is at risk, and that he may lose his livelihood as early as this Friday.

The mob demanding Hsu's defenestration is being led by a student named Kevin Bird, through his capacity as the President of Michigan State University's Graduate Employee's Union. Bird has said that he is targeting Hsu because he holds an administrative position as the Head of Research and Graduate Studies, yet no evidence of any bias in Hsu's professional activities, let alone sexual or racial

discrimination, has been presented, as far as I am aware. On the contrary, many women and people of colour who've worked with him have testified to his professional integrity.

Bird describes himself as a "democratic socialist" and can be seen on social media celebrating arson and vandalism:

 Several esteemed academics including Richard Haier and Robert Plomin have signed a counter-petition in defense of Stephen Hsu here. I am writing to you today, to ask that if you are an academic, could you please add your name to the counter-petition, to protect Stephen, but to also defend academic freedom and open inquiry, the foundational principles on which all scientific progress rests.

JK Rowling is Right—Sex Is Real and It Is Not a “Spectrum”

written by Colin Wright

JK Rowling recently drew fire on social media for tweeting the statements to the effect that “biological sex is real.” The tweets began when she mocked an opinion piece that used the term “people who menstruate” in place of “women” to account for the fact that transgender men also menstruate, and prefer not to be described as women.

The backlash on Twitter has been swift and cacophonous, and headlines have followed. GLAAD, an LGBT advocacy group, issued a response on Twitter, calling Rowling's tweets "inaccurate and cruel." One commenter wrote "I know you know this because you have been told over and over and over again, but transgender men can menstruate. Non-binary people menstruate. I, a 37-year old woman with a uterus, have not menstruated in a decade. Women are not defined by their periods."

Till now, even the most thematically ambitious feminist theorists have acknowledged that sex itself is a real biological phenomenon, and that sexual dimorphism is an important component of human existence as well as human rights. Yet increasingly, such common-sense propositions as JK Rowling's are now cast as hate speech.

As more and more people refer to themselves as trans, nonbinary, two-spirited, and gender-non-conforming, there's been a push to realign the objective reality of biological sex to match one's subjectively experienced gender identity. In the emerging view, the very notion of males and females existing as real biological entities is now seen as obsolete. Instead, some argue, we have only varying degrees of "male-ness" and "female-ness." And so the very idea of segregating sports (or anything, for that matter) using binary sex categories is seen as illegitimate, since, if no definitive line can be drawn, who's to say a purported "male" athlete isn't *really* female?

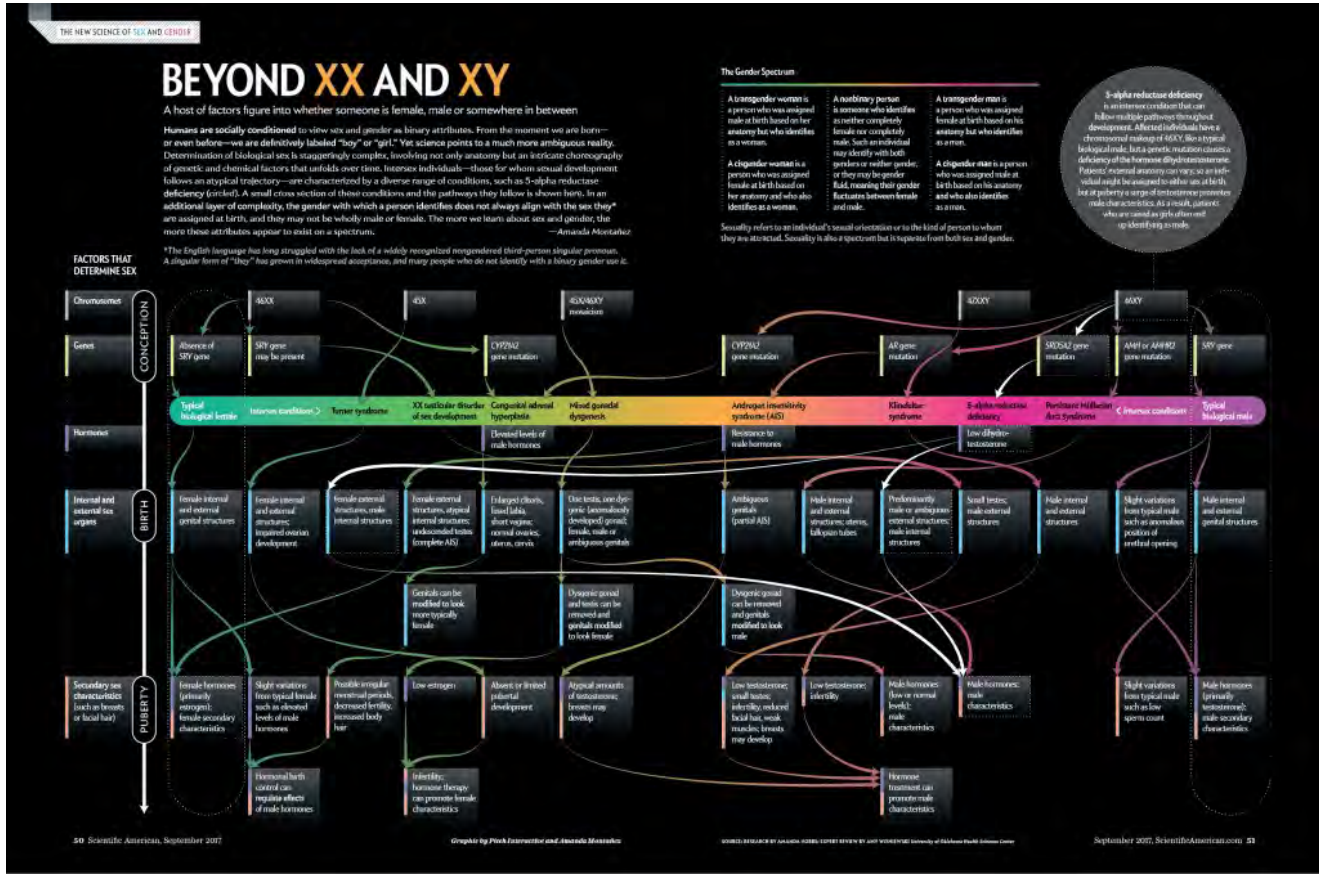

The view that sex is a spectrum is not confined to fringe critical theorists. It has made inroads into mainstream culture, thanks in part to a highly sympathetic media environment. Even prestigious scientific journals such as *Nature* have given space to authors who argue that "the idea of two sexes is simplistic" and that "biologists now think there is a wider spectrum than that." Another *Nature* editorial insisted that attempts to classify an individual's sex using any combination of anatomy and genetics "has no basis in science." A new book, *The Spectrum of Sex: The Science of Male, Female, and Intersex*, argues this position from cover to cover. Its publisher, a Canadian academic press, gushes that "this transformative guide completely breaks down our current understanding of biological sex."

In February of this year I co-authored a *Wall Street Journal* op-ed on the subject, entitled *The Dangerous Denial of Sex*. Along with my co-author, developmental biologist Emma Hilton, I highlighted the harms that sex-spectrum pseudoscience can impose on vulnerable groups, including children, women, gay men, and lesbians.

Since we were offered to be a newspaper op-ed format, Dr. Hilton and I had scant space to explore in detail the actual science of biological sex and the pseudoscience that is sex spectrum ideology. That is the subject of this essay.

* * *

There are two main arguments typically offered in defense of the claim that sex is a non-binary attribute that exists on a “spectrum.” The first is based around the existence of intersex conditions—people with intermediate or indeterminate sex characteristics. This argument claims sex cannot be binary if some individuals have sexual anatomy that appears to fall somewhere between male and female. This argument is frequently illustrated with figures that plot intersex conditions along a continuous axis that ranges from “typical female” to “typical male”—as with this widely reproduced figure from the 2017 *Scientific American* article, “Visualizing Sex As a Spectrum.”

Credit: Pitch Interactive and Amanda Montañez; Source: Research by Amanda Hobbs; Expert review by Amy Wisniewski University of Oklahoma Health Sciences Center

The second argument typically offered in defense of the sex-spectrum model is based around secondary sex organs and characteristics. Secondary sex organs encompass all elements of our reproductive anatomy—apart from the gonads, which are the primary sex organs. Secondary sex characteristics, on the other hand, are sex-related anatomies that differentiate during puberty, such as enlarged breasts and wider hips in females; and facial hair, deeper voices, more musculature, and broader shoulders in males. Because the distribution of these secondary sex characteristics can overlap between males and females, it is argued we should therefore view biological

sex as a continuum.

This way of thinking about biological sex is now frequently presented to children in school using such cartoon illustrations as The Genderbread Person (shown below). In the purple box labeled “Biological Sex,” you’ll notice the terms “male” and “female” are not used. Instead, terms denoting the idea of sex as a continuous variable—“male-ness” and “female-ness”—are chosen. Many of the traits listed as defining one’s degree of male-ness and female-ness are secondary sex organs and characteristics: genital morphology, body shape, voice pitch, and body hair. Conspicuously absent from this chart is any mention of primary sex organs (gonads, i.e. ovaries and testes in the case of females and males, respectively) or the typical functions associated with sex, such as menstruation in females and ejaculation in males. There is also no mention of eggs or sperm (produced by ovaries and testes, respectively).

The Genderbread Person v3.3

by its pronounced METROsexual.com

Gender is one of those things everyone thinks they understand, but most people don't. Like *Inception*, Gender isn't binary. It's not either/or. In many cases it's both/and. A bit of this, a dash of that. This tasty little guide is meant to be an appetizer for gender understanding. It's okay if you're hungry for more. In fact, that's the idea.

Both of these arguments—the argument from intersex conditions and the argument from secondary sex organs/characteristics—follow from fundamental misunderstandings about the nature of biological sex, which is connected to the distinct type of gametes (sex cells) that an organism produces. As a broad concept, males are the sex that produce small gametes (sperm) and females produce large gametes (ova). There are no intermediate gametes, which is why there is no spectrum of sex. Biological sex in humans is a binary system.

It is crucial to note, however, that the sex of *individuals* within a species isn't based on whether an individual can *actually* produce certain gametes at any given moment. Pre-pubertal males don't produce sperm, and some infertile adults of both sexes never produce gametes due to various infertility issues. Yet it would be incorrect to

say that these individuals do not have a discernible sex, as an individual's biological sex corresponds to one of two distinct types of evolved reproductive anatomy (i.e. ovaries or testes) that develop for the production of sperm or ova, regardless of their past, present, or future functionality. In humans, and transgender and so-called "non-binary" people are no exception, this reproductive anatomy is unambiguously male or female over 99.98 percent of the time.

The binary distinction between ovaries and testes as the criterion determining an individual's sex is not arbitrary, nor unique to humans. The evolutionary function of ovaries and testes is to produce either eggs or sperm, respectively, which must be combined for sexual reproduction to take place. If that didn't happen, there would be no humans. While this knowledge may have been cutting edge science in the 1660s, it's odd that we should suddenly treat it as controversial in 2020.

* * *

That above-cited 99.98 percent figure falls short of 100 percent because of the roughly 0.02 percent who are intersex. (The actual figure is estimated to be about 0.018 percent.) But the claim that intersex conditions support the sex spectrum model conflates the statement "there are only two sexes" (true) with "every human can be unambiguously categorized as either male or female" (false). The existence of only two sexes does not mean sex is never ambiguous. But intersex individuals do not demonstrate that sex is a spectrum. Just because sex may be ambiguous for some does not mean it's ambiguous (and, as some commentators would extrapolate, arbitrary) for all.

By way of analogy: We flip a coin to randomize a binary decision because a coin has only two faces: heads and tails. But a coin also has an edge, and about one in 6,000 (0.0166 percent) throws (with a nickel) will land on it. This is roughly the same likelihood of being born with an intersex condition. Almost every coin flip will be either heads or tails, and those heads and tails do not come in degrees or mixtures. That's because heads and tails are qualitatively different and mutually exclusive outcomes. The existence of edge cases does not change this fact. Heads and tails, despite the existence of the edge, remain discrete outcomes.

Likewise, the outcomes of sex development in humans are almost always unambiguously male or female. The development of ovaries vs testes, and thus females and males, are also qualitatively different outcomes that for the vast majority of humans are mutually exclusive and do not come in mixtures or degrees. Males and females, despite the existence of intersex conditions, remain discrete outcomes.

The existence of intersex conditions is frequently brought up in an attempt to blur the line between male and female when arguing for the inclusion of trans women in female sports and other contexts. But transgenderism has absolutely nothing to do

with being intersex. For the vast majority of individuals claiming either trans or non-binary identities, their sex is not in question. Primary sex organs, not identity, determines one's sex.

In regard to the argument from secondary sex organs/characteristics, the primary flaw is that it confuses cause and effect. Remember, secondary sex characteristics are anatomies that differentiate during puberty. In females, these include (among others) the development of breasts, wider hips, and a tendency for fat to store around the hips and buttocks. In males, secondary sex characteristics include deeper voices, taller average height, facial hair, broader shoulders, increased musculature, and fat distributed more around the midsection. However, these secondary sex characteristics—while plain to the eye, and inseparable from the way most laypeople think about men and women—do not actually define one's biological sex. Rather, these traits typically develop as a *consequence* of one's sex, via differences in the hormonal milieu produced during puberty by either testes or ovaries.

The different developmental trajectories of males and females are themselves a product of millions of years of natural selection, since secondary sex characteristics will contribute to evolutionary fitness in males and females in different ways. Females with narrower hips had more trouble delivering large-headed children, and so those with larger hips had an evolutionary advantage. This wasn't relevant to males, however, which is one reason why their bodies tend to look different. But that doesn't mean that a person's hips—or any of their secondary sex characteristics, including beards and breasts—*define* their sex biologically. These traits, while having evolved due to sex-specific selection pressures, are completely irrelevant when it comes to defining one's biological sex.

Analogies help, so let me offer another one. Bikers ride motorcycles, and cyclists ride bicycles. While these two vehicles share many similarities (two wheels, handlebars, seats, spokes, etc.), they differ in at least one fundamental way. Motorcycles are powered by engines and fuel, while bicycles are powered by pedaling legs. Whether someone is a biker or a cyclist depends entirely on the binary criterion of whether they are riding a motorcycle or a bicycle. This is the *primary* characteristic that defines bikers and cyclists. However, there are also many *secondary* characteristics associated with bikers and cyclists. Bikers, for instance, are more likely to wear leather jackets, jeans, and bandanas. Cyclists are more likely to wear skin-tight spandex. Bikers wear heavy helmets that contain the entire head and include a face-shield. Cyclists typically wear lightweight helmets that cover only the top of their heads.

Many of the secondary characteristics of bikers and cyclists are not arbitrary or coincidental. Like male and female secondary sex characteristics, we can map the utility of biker and cyclist secondary characteristics to their primary characteristics. Bikers wear tough clothes because they travel at higher speeds, which necessitate protective clothing in case of an accident and to mitigate windchill. Cyclists, on the other hand, exert great physical effort pedaling their entire body weight plus the

weight of their vehicle, which necessitates lighter, breathable, wind-breaking clothing and protective gear. Given cyclists' slower crash speeds, the trade-off in favor of less protective gear is worthwhile.

But a person riding a motorcycle wearing a spandex suit and lighter helmet doesn't become a cyclist (or less of a biker) because they share these secondary traits more commonly associated with cyclists. And a person riding a bicycle wearing jeans and a leather jacket doesn't become a biker (or less of a cyclist) by sharing secondary traits more typical of bikers. Just as these secondary traits do not define bikers and cyclists, secondary sex characteristics do not define males and females.

* * *

Because biology is complex, people can be easily swayed with graphs and drawings, especially if they purport to prove something we want to believe anyway—such as the supposedly liberating notion that sex is a spectrum instead of a binary. But a spectrum implies a quantitative axis and, when this is taken seriously, leads to troubling conclusions. One particularly popular graphical depiction presents sex as bimodal—meaning that there are two maxima representing “male-ness” and “female-ness,” around which most people tend to cluster. A [viral tweet](#) by Twitter user @ScienceVet2, now with over 17,000 retweets, conveyed the bimodal sex spectrum model using a figure similar to the one below.

You can see why this sort of representation would prove popular: It accords with our intuitive sense that most of us cluster around a male or female typology, while also preserving the conceit that there is a vast, inhabitable continuum between these two categories. Presumably, one could even take various measurements to determine exactly where along the spectrum we reside.

Again, this all sounds very progressive in theory. But the consequences are regressive in practice, since the indicia of male-ness and female-ness invoked by sex-spectrum

enthusiasts will always be based on sexist ideals and stereotypes that our grandparents would have recognized.

In the modified figure below, is male A “more” male than male B? Is female D “more” female than female C? For decades, we’ve properly taught our children that this kind of logic is insulting and toxic—that a girl with more masculine features is just as much a girl as her friend with a more stereotypically feminine physique. Whether the figure’s x-axis is quantifying genital morphology or an amalgam of secondary sex traits or behaviors, the implication is that tall, aggressive males with thick beards, deep voices, large penises, and higher testosterone are “more” male than short males with meeker personalities who answer to the opposite description. Likewise, females with larger breasts, a more “feminine” waist-to-hip ratio, and less body hair would be considered “more” female than small-breasted, less curvy, hairier females.

If this sex-spectrum logic strikes you as awfully similar to playground bully logic, you’re right. Imagine the following scenario: James, 16, is a very effeminate boy. He gets relentlessly bullied in high school for his feminine appearance and mannerisms. His classmates tease, “What, are you a girl?” His teacher, upon overhearing this, consults his sex-spectrum chart and tells the class: “maybe.”

Another worrying corollary of this notion is that surgical intervention on intersex infants (sometimes called intersex genital mutilation) can change an individual’s actual location along a pseudo-scientific sex spectrum. A parent may then feel more justified in opting for other “corrective” surgeries, sometimes at odds with an infant’s true (gonadal) biological sex, in order to make their child “ideally” (in their minds) more male or more female. To be fair, most sex-spectrum advocates decry surgical intervention on intersex infants (and rightfully so, in my opinion), but fail to consider how their doctrines may encourage such practices.

The promise of sex-spectrum pseudoscience—that one’s sex is impossible to definitively determine—has a natural appeal to those who already find themselves wrestling with issues connected to their identity. It’s empowering to imagine that we

may have control over something so basic as sex. In *Sex Redefined*, a 2015 article that appeared in *Nature*, authored by sex-spectrum advocate Dr. Claire Ainsworth, the final paragraph reads:

“My feeling is that since there is not one biological parameter that takes over every other parameter, at the end of the day, gender identity seems to be the most reasonable parameter,” says Vilain. In other words, if you want to know whether someone is male or female, it may be best just to ask.

Here Dr. Eric Vilain, a clinician and the director of the Center for Gender-Based Biology at the University of California, Los Angeles, claims that since biological sex cannot be reduced to “one biological parameter” (not true), we should therefore abandon sex classifications altogether in favor of one’s entirely subjective gender identity. This is a baffling conclusion since, even if the sex spectrum model were correct, it in no way follows that one can choose where along the spectrum they reside. Furthermore, in Ainsworth’s interpretation of Vilain’s words, we see a not-so-subtle shift from the claim that sex is a spectrum to the much more extreme claim that sex is arbitrary and meaningless. According to this understanding, a person may literally reimagine their biology, as if by alchemy, by merely stating so. What an astounding power for humans to claim. If only it actually existed.

* * *

Some trans–rights activists have asked why it should be that people like me are so fixated on an issue where the stakes seem so small. But the stakes *aren’t* small: If the idea of biological sex can be overturned in the domain of athletic competition, where differences between male and female are abundantly obvious, then the battle to push back sex-spectrum pseudoscience in every other area will be lost—from the admission of males into female prisons and rape-crisis centers, to the facilitation of sex-change surgery for schoolchildren. As Thomas Sowell succinctly stated in his book *The Quest for Cosmic Justice*, “there is only so much divergence between prevailing theories and intractable reality that a society can survive. Yet theories of equality are unlikely to be re-examined—or examined the first time—when they provide a foundation for the heady feeling of being morally superior to a benighted ‘society.’”

Advocates of the sex-spectrum model no doubt meant well when these theories originally were developed. After all, who *wouldn’t* be partial to an explanation of human biology that validated all of our shifting forms of self-conception and understanding? But over time, it’s become clear that they created a false theory of biology that distorts human nature and harms vulnerable individuals. When one attempts to achieve equality and justice by distorting reality, inequality and injustice are never eliminated, just relocated.

Colin Wright is an assistant editor at *Quillette* and holds a PhD in evolutionary biology from the University of California, Santa Barbara. You can follow him on Twitter at [@SwipeWright](#).

Yet another example of a progressive socialist being attacked by her own kind.

In my heart, I'm egging the trannies on.

Lord, save her, but not yet.

Stephanie

Great article, very clear on the many layers and intricacies of gender critical insanity. I am most troubled by *Nature* bowing to this ascientific drivel. How do they maintain their self-respect?

Fire Stephen Hsu.

Scientific racism has no place in an equitable and just institution. It has been allowed to flourish at MSU for too long.

Project maintained by [firestephenhsu](#)
Hosted on GitHub Pages — Theme by [mattgraham](#)

UPDATE: Hsu has resigned.

[See the statement from MSU here.](#)

We sincerely thank all of you who had the courage to speak out and took the time to engage with this important work.

The reception we received was beyond our imaginings. It is clear this is a deep pain that has been bubbling under the surface at our institution for many years, and we are not done engaging with and trying to heal that damage.

But for now, thank you.

Note: If you would like your name removed from this public-facing site, please let us know. Otherwise, the petition will be updated soon with all names submitted prior to Hsu's resignation.

An Open Letter to Michigan State University

We are faculty, students, support staff, and allies within and outside Michigan State University demanding that Stephen Hsu be removed from his position as Senior Vice President for Research and Innovation.

The concerns expressed by the Graduate Employees Union [\[twitter\]](#) [\[unrolled\]](#) and other individuals familiar with Hsu indicates an individual that cannot uphold our University Mission or [our commitment to Diversity, Equity, and Inclusion](#). Given this discordance with university values, Stephen Hsu should not be privileged with the power and responsibility of recruiting and funding scholars, overseeing ethical conduct, or coordinating graduate study.

By signing this open letter we ask MSU to follow through to its commitment to be a diverse and inclusive institution and to change its institutional and administrative practices so that the passion and talent of Black scholars, Indigenous scholars, and other scholars of color (BIPOC) can be recognized and fostered within these university halls.

We currently have **820** signatures. **You can add your signature [here](#).** * Please note due to the nature of the open letter we are unable to completely verify submissions. If your name has been falsely submitted, or if there is an error with your submission, please email president@geuatmsu.org and/or organizing@geuatmsu.org

See another internal letter started by MSU faculty, currently signed by 546 faculty, staff, and graduate students at MSU, [here](#). Those at MSU are welcome to sign both petitions; this petition is intended to be available to those both inside and outside the institution. The number of signatories of each petition is not meant to be or expected to be mutually exclusive.

Signatories of this letter agree also not to interfere with or harass any counter-petitions which arise. We condemn such measures and will follow up on any reports that our supporters are engaging in any such behavior.

Signatures

Last Update: June 19, 5:27 PM EST

Bolded names indicate population geneticists. We highlight these individuals by their request to emphasize that Hsu's views have no basis in the scientific community.

President Samuel L. Stanley
Michigan State University, East Lansing, MI

Dear President Samuel L. Stanley:

We, the undersigned, write out of concern with the risk of principles of academic freedom, scientific integrity, and fair play currently posed at Michigan State University (MSU) because of baseless allegations against a respected colleague, Dr. Stephen Hsu, VP for Research and Innovation.

The charges of racism and sexism against Hsu are unequivocally false and the purported evidence supporting these charges ranges from innuendo and rumor to outright lies. (See attached [letters](#) for details.) We highlight that there is zero concrete evidence that Hsu has performed his duties as VP in an unfair or biased manner. Therefore, removing Hsu from his post as VP would be to capitulate to rumor and character assassination.

President Stanley, you have the unique opportunity to show the leadership required to guide this great institution of higher learning through a difficult situation during this pivotal moment in history. The power is in your hands to reaffirm free inquiry and free expression as the core values of the academic institutions and show how they align with the other values to which we are all committed and have spent time and energy promoting. The voices demanding Hsu's removal are exactly wrong in pitting diversity and inclusion against free inquiry and freedom of speech. Instead, true diversity flourishes best under conditions of free inquiry, because such a philosophy demands that everyone have a seat at the table and that views be evaluated on the basis of cogency of the supporting reasoning and strength and internal consistency of the accumulated evidence rather than the identity, power, number, or vociferousness of the people expressing them. Free inquiry is the most democratic and most inclusive method of engaging with the world.

A university must simultaneously uphold the ideals of inclusion and freedom of inquiry. With respect to the latter, if faculty feel uncomfortable investigating “difficult” questions—the answers to which may or may not agree with a particular belief or view, and

may even be unsettling—then the faculty will eventually stop asking those questions. In turn, the university will cease to be a leader in addressing the most difficult problems that society faces. Ideology will become the major force in the faculty's scholarship.

To remove Hsu for holding controversial views, or for inquiring about controversial topics, or for simply talking to controversial personalities, based on the number of people demanding he be removed and the intensity of their demands would be to capitulate to a pre-enlightenment approach to the academy – and to incentivize the exclusion and ostracism of minority positions. It would also set a dangerous precedent, inconsistent with the fundamental principles of modern enlightened higher education.

Professor Hsu is a thoughtful, decent, and compassionate human being who approaches complex questions with honesty and openness. To allow Hsu to be removed by falsehoods and innuendos would be to concede that there is no place in the academy for someone who has committed no crime or injustice toward any individual, but merely disagrees with the prevailing orthodoxy.

There is no question that the push for racial justice and equal rights has been and continues to be a noble and important cause. In the narrow case, removing Hsu from his position will in no way advance this cause. In the general case, removing Hsu will do permanent damage to the university and will undermine the core values that we must uphold.

Twitter Attacks, and a Defense of Scientific Inquiry

I have not responded to these nasty [Twitter attacks](#), but unfortunately they have gotten enough traction that I feel I need to respond now. [Note: I have been informed that some of the signatures on their petition are fake, including one purported to be from my colleague Corey Washington! See [counter petition and support letters](#) on my behalf.]

The attacks attempt to depict me as a racist and sexist, using short video clips out of context, and also by misrepresenting the content of some of my blog posts. A cursory inspection reveals bad faith in their presentation.

The accusations are entirely false -- I am neither racist nor sexist.

The Twitter mobs want to suppress scientific work that they find objectionable. What is really at stake: academic freedom, open discussion of important ideas, scientific inquiry. All are imperiled and all must be defended.

One of the video clips is taken from an interview I did with YouTuber Stefan Molyneux in 2017. Molyneux was not a controversial figure in 2017, although he has since become one. Prominent scientists working on human intelligence who were interviewed on his show around the same time include [James Flynn](#) and [Eric Turkheimer](#). (Noam Chomsky was also a guest some time after I was.) Here is what I said to Molyneux about genetic group differences in intelligence:

Here is a [similar interview](#) I did with University of Cambridge PhD student [Daphne Martschenko](#):

As you can see, contrary to the Twitter accusations (lies), I **do not** endorse claims of genetic group differences. In fact I urge great caution in this area.

The tweets also criticize two podcasts I recorded with my co-host Corey Washington: a discussion with a prominent MSU Psychology professor who studies police shootings (this discussion has elicited a strong response due to the tragic death of George Floyd), and with [Claude Steele](#), a renowned African American researcher who discovered Stereotype Threat and has been Provost at Columbia and Berkeley. The conversation with Steele is a nuanced discussion of race, discrimination, and education in America.

The blog posts under attack, dating back over a decade, are almost all discussions of published scientific papers by leading scholars in Psychology, Neuroscience, Genomics, Machine Learning, and other fields. The papers are published in journals like Nature and the Proceedings of the National Academy of Sciences. However, a detailed reading is required to judge the research and related inferences. I maintain that all the work described is well-motivated and potentially important. Certainly worthy of a blog post. (I have written several thousand blog posts; apparently these are the *most* objectionable out of those thousands!)

In several of the blog posts I explicitly denounce racism and discrimination based on identity.

This paper, from 2008, discusses early capability to ascertain ancestry from gene sequence. The topic was highly controversial in 2008 (subject to political attack, because it suggested there could be a genetic basis for "race"), but the science is correct. It is now common for people to investigate their heritage using DNA samples (23andMe, Ancestry) using exactly these methods. This case provides a perfect example of science that faced suppression for political reasons, but has since been developed for many useful applications.

This 2016 paper is by the UCSD Pediatric Imaging, Neurocognition, and Genetics collaboration. They claim that fMRI features of brain morphology can be predicted by genetic ancestry via machine learning.

<https://infoproc.blogspot.com/2016/03/genetic-ancestry-and-brain-morphology.html>

These blog posts discuss the firing of software engineer James Damore by Google over a memo on diversity practices. The first post describes the legal situation and quotes a professor of labor law at Notre Dame. The second compares the claims made in Damore's memo to an article in the Stanford Medical School magazine, which covers similar material and was (by coincidence) published around the same time.

<https://infoproc.blogspot.com/2017/08/meanwhile-down-on-farm.html>

These papers discuss evidence from large DNA datasets for recent natural selection in human evolution. This research has been attacked for political reasons, but should be defended since it addresses fundamental questions in deep human history and evolution.

Regarding my work as Vice President for Research, the [numbers speak](#) for themselves. MSU went from roughly \$500M in annual research expenditures to about \$700M during my tenure. We have often been ranked #1 in the Big Ten for research growth. I participated in the recruitment of numerous prominent female and minority professors, in fields like Precision Medicine, Genomics, Chemistry, and many others. Until this Twitter attack there has been *not even a single allegation* (over 8 years) of bias or discrimination on my part in promotion and tenure or faculty recruitment. These are two activities at the heart of the modern research university, involving hundreds of individuals each year.

Academics and Scientists must not submit to mob rule.
