Are birthrates the most important economic issue in the world today? Most countries of the developed world today have birth rates significantly less than replacement levels. In some countries, such as South Korea and China it is less than half the number required to sustain their current populations. Within the next 20 years, this shift will result in a massive transfer of economic and political power to those countries with younger populations. Meanwhile much of Europe and Asia will be struggling to take care of their aging populations with a rapidly declining cohort of younger workers. This massive realignment will have huge consequences both locally and internationally for much of the world. Join us with two of the foremost experts in this area of demographics to consider the effects of this decline in childbearing and consider what can be done to reverse this trend and prepare for the economic impact of this demographic shift that will be larger than that caused by Climate Change.
